

Selection

the standard precaution

Clean rule: keep only nodes
with no anomalous neighbors

Sec. 5

Calibration degree shifts low
(7× below test normals)

Sec. 6.1

*only if score
increases with
degree ($\rho = 0.92$)*

Calibration scores run low

Sec. 4

Null p-values shrink: normal
test nodes look extreme

Sec. 4

FDR inflated: 0.782 realized
against nominal $\alpha = 0.10$

Sec. 6.1

silent: output looks normal

Contamination

the standard concern

Anomalies enter calibration
(5–10% of the draw)

Sec. 5

Anomalies occupy the top
calibration ranks

Sec. 4

P-value floor $1/(n_{\text{cal}} + 1)$ rises

Fact 1

Benjamini-Hochberg
rejects less often

Sec. 3.1

FDR $\leq \alpha$: power falls
toward zero

Sec. 6.3

visible: procedure goes quiet
